# From fill to field – keep every container accounted for.

Kahler Automation's Container Tracking gives you complete visibility into every container across your operation—from warehouse inventory to customer locations. Designed for mini-bulks, shuttles, totes, jugs, and more, it helps eliminate contamination, improve traceability, and simplify compliance with a centralized, paperless tracking system.

## Eliminate guesswork.

Every container's location, contents, capacity, and activity are recorded in real time, giving your team confidence that inventory is accurate and containers are exactly where they should be.

## Protect product integrity.

Prevent contamination by assigning products to specific containers and ensuring they are only filled with approved materials. Automated validation helps reduce costly mistakes before they happen.

## Simplify compliance.

Maintain detailed activity logs, inspection records, and paperless documentation that support regulatory compliance while making audits and reporting easier.

## Built for efficient operations.

Integrated with Kahler Automation's terminal management TMX, Container Tracking combines inventory management, wireless access, barcode technology, and automated dispensing into one streamlined solution.

## Complete visibility for every container

### Barcode-enabled tracking

Quickly identify containers and equipment while improving accuracy throughout your facility.

### Real-time container visibility

Track container location, inventory, fills, transfers, sales, and customer custody from a single system.

### Inventory management

Maintain accurate inventory levels for both bulk storage and product within individual containers.

### Activity history

View a complete audit trail for every container, including fills, movements, inspections, and transactions.

### Wireless accessibility

Access container, inventory, and order information from PCs, tablets, or wireless terminals throughout your operation.

### Integrated automation

Works seamlessly with Kahler Automation software and other ERP and agronomy systems.

### Other features

Supports automated value control, scale-based dispensing, and remote start/pause/stop controls.
